

Amendments to the Specification:

Please replace the Abstract of the Disclosure with the following amended paragraph:

A method of providing access to Business Applications (BA) ~~executed on a data processing system wherein said BAs offer~~ offering their services and interactively controlled by a multitude of BA panels, ~~and wherein said BAs may display the BAs~~ displaying succeeding BA panels dependent on user interactions, user specified data and the contents of any kind of data base the BA is operating on. ~~This inventive method consists in two major steps. In a first step the~~ The individual panels, the sequence of the panels as they are displayed by the BA and the activities required to launch a BA to display a succeeding panel ~~are described. This step results in a~~ User Interaction Graph (UIB) ~~directed graph modelling modeling~~ the spectrum of panel interactions with a BA, ~~called a User Interaction Graph (UIG).~~ By analyzing the UIB the proposed method then generates in a ~~second step procedures, called~~ Analyzing the UIB generates Transaction Methods (TM) ~~. When called, the TM procedures are~~ capable of ~~for~~ autonomously executing and controlling the BAs by ~~handling~~ a sequence of BA panels which, ~~. Based on input~~ parameters passed over to the TMs they autonomously fill the ~~various BA panels~~ with the correct input information passed over the TMs, initiate the required activities for traversing through a certain panel sequence and returning the output information gathered during its execution.
